

## **Multivariate Chi-square Tests of Significance (Chi-square Tests for Categorical IV, Categorical DV and Categorical CV)**

This is an analysis of data from the 2022 General Social Survey (GSS). The GSS is a repeated cross-sectional study involving a survey of non-institutionalized U.S. adults ages 18 and older that measures various attitudes, opinions and behaviors. It has been conducted every other year since 1972, allowing social scientists to assess change over time in the values, beliefs, attitudes, opinions and behaviors of the U.S. adult population, specifically those related to social inequality, health and well-being, politics and law, family, religion, and key social issues such as technology, sustainability, capital punishment, abortion, voting rights, etc.

I will be dissecting data from the 2022 General Social Survey to conduct a series of Chi-square tests examining respondents' views on prayer in schools.

**DV: PRAYER.**

**IV: RELPERSN**

This is self-reported by the respondent, so it reflects their perception of their religiosity. That does not make this measure invalid in any way; this is the respondent's classification of themselves, it is not based on an objective set of criteria such as attendance at religious services, reading religious scripture, etc. In many ways a self-reported measure is preferred because how one perceives their religiosity likely affects their values, beliefs, behaviors, etc. more so than an objective or quantified classification! As with many social constructs, perception (in this case, relative assessment) often matters more than "reality"!

**CV:** The control variable is a measure of respondent's sex (male or female) - **SEX**. NOTE: this is a very crude (basic) measure of sex that is dichotomous. The researchers acknowledge that this does not encompass all possible categories for classifying individuals on the basis of their sex. Again, that does not make the measure invalid - it just means we cannot generalize these findings beyond the two groups represented.

The given data reads that more than one half of respondents (53.8%) are female. The majority of respondents (32.1%) are moderately religious, and a little more than half of respondents (51.5%) support the US Supreme Court decision to not require the reading of the lord's prayer or Bible verses in public schools.

DV = PRAYERIV = RELPERSN

## **Hypotheses for Bivariate Chi-square Test**

H<sub>a</sub>: Those who are not at all religious will be more likely than those who are moderately religious to approve of the U.S. Supreme Court ruling prohibiting state or local governments from requiring the reading of the Lord's Prayer or Bible verses in public schools.

H<sub>0</sub>: There is no relationship between a person's religiosity and whether or not they approve of the U.S. Supreme Court ruling prohibiting state or local governments from requiring the reading of the Lord's Prayer or Bible verses in public schools.

This hypothesis is formed under the context of the concept that those who identify as moderately religious will want religious material taught in schools for the purpose of theological education. Non-religious people may not want theological education to be mandatory among public schools due to their own beliefs conflicting with it. Individuals identifying as moderately religious may also be more likely than nonreligious individuals to have children in order to conform with social as well as spiritual standards of religiosity; those with children would be more likely to care about theological education in public schools.

**The United States Supreme Court has ruled that no state or local government may require the reading of the Lord's Prayer or Bible verses in public schools. What are your views on this--do you approve or disapprove of the court ruling? \* To what extent do you consider yourself a religious person? Are you very religious, moderately religious, slightly religious, or not religious at all? Crosstabulation**

Count

		To what extent do you consider yourself a religious person? Are you very religious, moderately religious, slightly religious, or not religious at all?			
		Very religious	Moderately religious	Slightly religious	Not religious at all
The United States Supreme Court has ruled that no state or local government may require the reading of the Lord's Prayer or Bible verses in public schools. What are your views on this--do you approve or disapprove of the court ruling?	Approve	58	153	152	218
	Disapprove	124	246	110	69
Total		182	399	262	287
Total		1130			

## **Chi-Square Tests**

	Value	df	Asymptotic Significance (2-sided)
Pearson Chi-Square	128.896 <sup>a</sup>	3	<.001
Likelihood Ratio	133.492	3	<.001
Linear-by-Linear Association	123.716	1	<.001
N of Valid Cases	1130		

a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 88.42.

We found support for the claim that there is a relationship between religious identification and approval or disapproval for the Supreme Court decision to not allow state or local governments the right to integrate required theological education into public school systems. Specifically, religious-identifying individuals are more likely than nonreligious individuals to disapprove of the Supreme Court's decision to not allow state or local governments to require theological education in public schools (56.93% and 24.04%, respectively).

## Rerunning the Chi-square test, this time adding SEX as a control variable

The United States Supreme Court has ruled that no state or local government may require the reading of the Lord's Prayer or Bible verses in public schools. What are your views on this--do you approve or disapprove of the court ruling? \* To what extent do you consider yourself a religious person? Are you very religious, moderately religious, slightly religious, or not religious at all? \* CODE RESPONDENT'S SEX  
Crosstabulation

c. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 48.67.

## Cross-tabulation Analyses for Relationships between Categorical IV and Categorical DV

**The Set Up:** This is an analysis of data from the 2022 General Social Survey (GSS). The GSS is a repeated cross-sectional study involving a survey of non-institutionalized U.S. adults ages 18 and older that measures various attitudes, opinions and behaviors. It has been conducted every other year since 1972, allowing social scientists to assess change over time in the values, beliefs, attitudes, opinions and behaviors of the U.S. adult population, specifically those related to social inequality, health and well-being, politics and law, family, religion, and key social issues such as technology, sustainability, capital punishment, abortion, voting rights, etc. (CONTINUED)

This is an examination of the **relationships between certain variables** using the bivariate test of **cross tabulation** to assess relationships between two categorical variables. All variables used in these analyses help to understand how sociodemographic characteristics shape peoples' views on different social issues.

## Part I: Cross-tabulation of the relationship between educational attainment and views on government responsibility to help people afford medical care

**HYPOTHESIS TO TEST:** Those who consider themselves to be very religious will be more likely than those who consider themselves to be not religious at all to feel that the government should help people pay for medical care (doctors and hospital bills).

In general, some people think that it is the responsibility of the government in Washington to see to it that people have help in paying for doctors and hospital bills. Others think that these matters are not the responsibility of the federal government an * To what extent do you consider yourself a religious person? Are you very religious, moderately religious, slightly religious, or not religious at all?							
			To what extent do you consider yourself a religious person? Are you very religious, moderately religious, slightly religious, or not religious at all?				
			Very religious	Moderately religious	Slightly religious	Not religious at all	Total
In general, some people think that it is the responsibility of the government in Washington to see to it that people have help in paying for doctors and hospital bills. Others think that these matters are not the responsibility of the federal government an	Government should help	Count	114	259	221	342	936
		% within To what extent do you consider yourself a religious person? Are you very religious, moderately religious, slightly religious, or not religious at all?	42.9%	45.7%	53.6%	63.8%	52.6%
	Agree with both	Count	101	248	169	162	680
		% within To what extent do you consider yourself a religious person? Are you very religious, moderately religious, slightly religious, or not religious at all?	38.0%	43.7%	41.0%	30.2%	38.2%
	People should care for themselves	Count	51	60	22	32	165
		% within To what extent do you consider yourself a religious person? Are you very religious, moderately religious, slightly religious, or not religious at all?	19.2%	10.6%	5.3%	6.0%	9.3%
	Total	Count	266	567	412	536	1781
		% within To what extent do you consider yourself a religious person? Are you very religious, moderately religious, slightly religious, or not religious at all?	100.0%	100.0%	100.0%	100.0%	100.0%

**INTERPRETATION:** The results do not support the hypothesis that those who consider themselves to be very religious will be more likely than those who consider themselves to be not religious at all to believe that the government should help pay for medical care (doctors and hospital bills). There is a moderate negative

relationship between participant religiosity and belief in whether or not the government should help pay for medical care. Specifically, 42.9% of those who consider themselves very religious believe the government should help people pay for medical care, and 63.8% of those who consider themselves not religious at all believe the government should help people pay for medical care. This may be because of political affiliation corresponding to identified religiosity, as government paying for medical care is a common topic in US politics. This may also be due to highly-religious individuals potentially having less personal desire for medical intervention as it may contradict their religious beliefs. Participants identifying as highly religious may also feel that medical intervention is unnecessary for all due to their own religious beliefs.

## Part II: Cross-tabulation assessing the relationship between job satisfaction and identified sex

**HYPOTHESIS TO TEST:** Males will be more likely than females to be satisfied with their jobs.

On the whole, how satisfied are you with the work you do -- would you say you are very satisfied, moderately satisfied, a little dissatisfied, or very dissatisfied? \* CODE RESPONDENT'S SEX  
Crosstabulation

			CODE RESPONDENT'S SEX		
			Male	Female	Total
On the whole, how satisfied are you with the work you do -- would you say you are very satisfied, moderately satisfied, a little dissatisfied, or very dissatisfied?	Very satisfied	Count	511	586	1097
		% within CODE RESPONDENT'S SEX	45.7%	44.0%	44.8%
	Moderately satisfied	Count	465	543	1008
		% within CODE RESPONDENT'S SEX	41.6%	40.8%	41.1%
	A little dissatisfied	Count	96	142	238
		% within CODE RESPONDENT'S SEX	8.6%	10.7%	9.7%
	Very dissatisfied	Count	47	60	107
		% within CODE RESPONDENT'S SEX	4.2%	4.5%	4.4%
Total	Count	1119	1331	2450	
	% within CODE RESPONDENT'S SEX	100.0%	100.0%	100.0%	

**INTERPRETATION:** The results do not support the hypothesis that female participants will be less likely than male participants to report satisfaction with their job. There was no relationship between job satisfaction and sex of respondents. Specifically, 45.7% of males, and 44% of females report being very satisfied with their job. This may be because of participants feeling satisfaction with their job based on societal expectation of job attainment; female participants having jobs that do not pay well and male participants having jobs that do pay well, and the satisfaction when such expectations are incorrect. It may also be due to social desirability of jobs based on sex; female participants may strive for work positions deemed “feminine”, while male participants may strive for work positions deemed “masculine”. This may also be due to satisfaction in fulfillment of a social role; participants may feel satisfaction in participating in the economy.
